- In comparison, the Bloomberg U.S. Aggregate Bond Index (the “Index”) returned 8.02% for the same period.

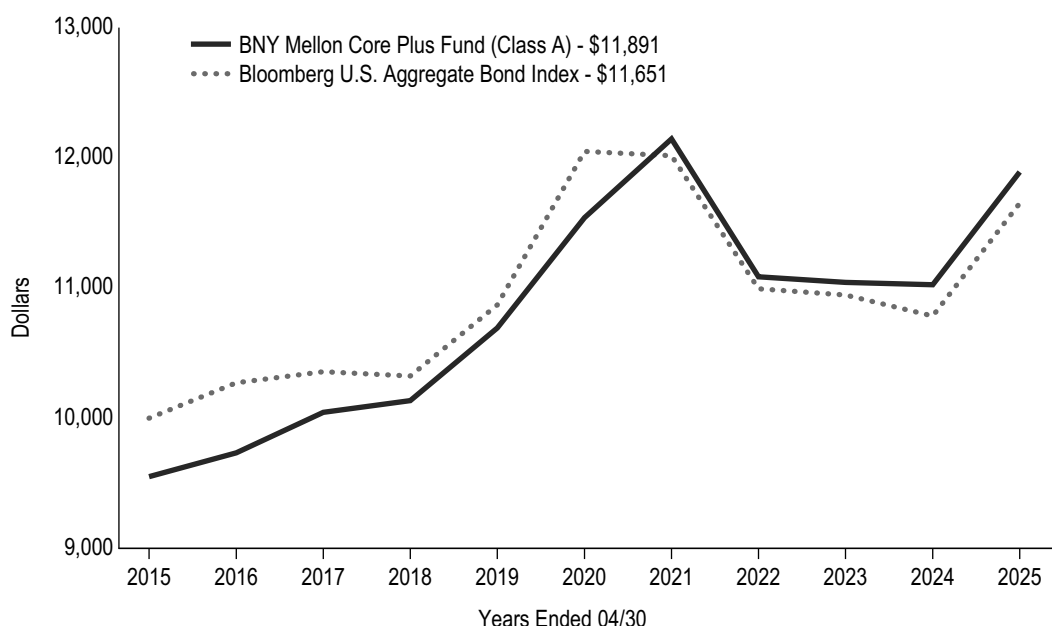

What affected the Fund’s performance?

- Global fixed income returns were mixed as inflation eased, the yield curve steepened, and rates fell; markets weakened late in the period amid rising concerns over U.S. tariffs.
- U.S. and international interest rate positioning generated gains. Security selection added value, particularly in capital goods and banking. Overweights to high yield corporates, agency mortgage-backed and esoteric asset-backed securities contributed.
- An underweight to U.S. Treasuries contributed. Overweights to consumer non-cyclicals, and capital goods added value. An underweight to long-maturity corporates helped as the credit curve steepened.
- Investment grade credit underperformed. An overweight to energy detracted amid lower commodity prices. An overweight to electric utilities also weighed on results due to elevated supply and persistent wildfire risk.
- Security selection in electric utilities detracted, as subordinated structures underperformed. Coupon positioning in agency mortgage-backed securities was negative. An overweight to 30-year UK gilts also lagged amid rising yields.
